

Abstract of the Disclosure

5 A first structure comprising a permanent magnet having a magnet surface adapted to be positioned along a surface of a second structure comprising a layer of ferrous or ferromagnetic material so that one of the structures can be supported on the other structure by magnetic attraction. The first structure further comprises a layer of removable pressure sensitive adhesive having a surface parallel with its magnet surface adapted to releasably adhere to the surface of the second structure and thereby significantly restrict slipping of the surfaces of the first and second structures along each other.
